

Introduction to Spyder

In this lecture

- How to execute a Python file?
- How to execute pieces of code - Run?
- How to add comments?
- How to reset and clear console

File execution

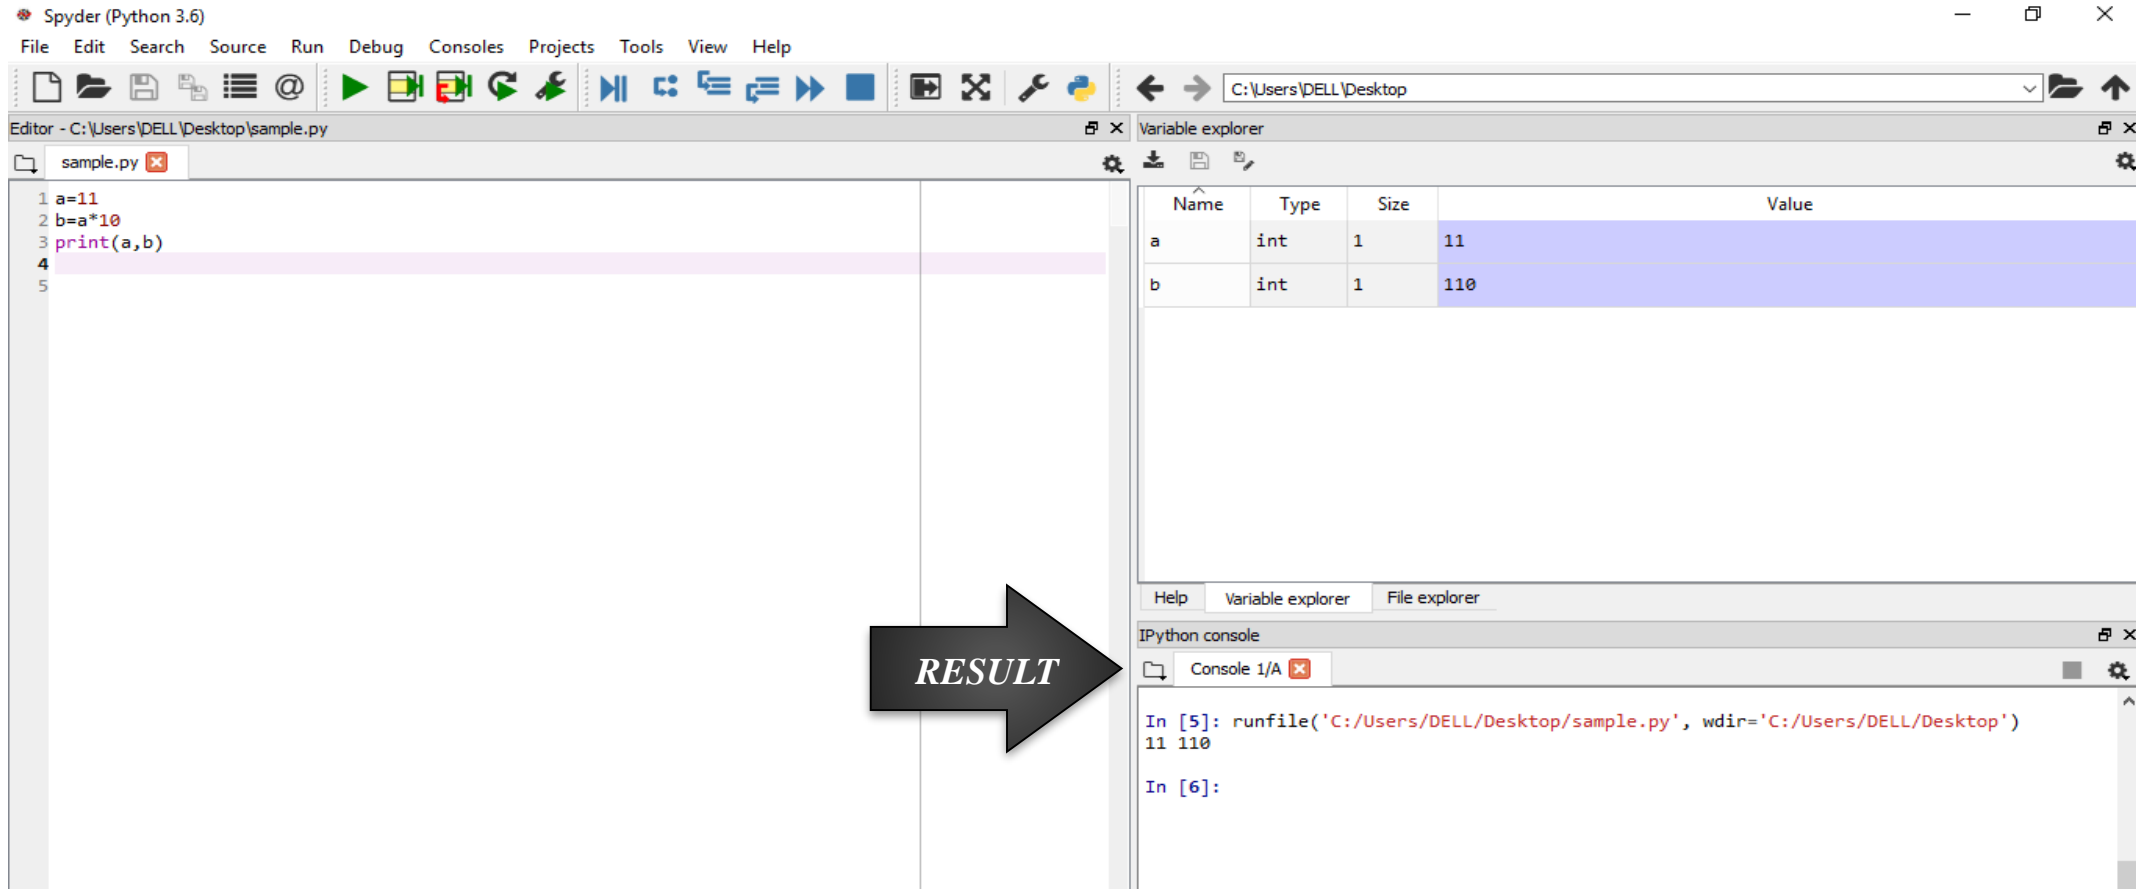

Executing script files

To run full code:-
1. Press '*Run file*' from icon bar
2. *F5* to run full code

To run chosen line, select the line and
1. Press '*Run selection*' from icon bar
2. Press *Ctrl+Enter* or *F9*

Executing script files using Run file/F5

The screenshot shows the Spyder Python IDE interface. The editor window displays a Python script named `sample.py` with the following code:

```
1 a=11
2 b=a*10
3 print(a,b)
4
5
```

The Variable explorer on the right shows the state of the program's variables:

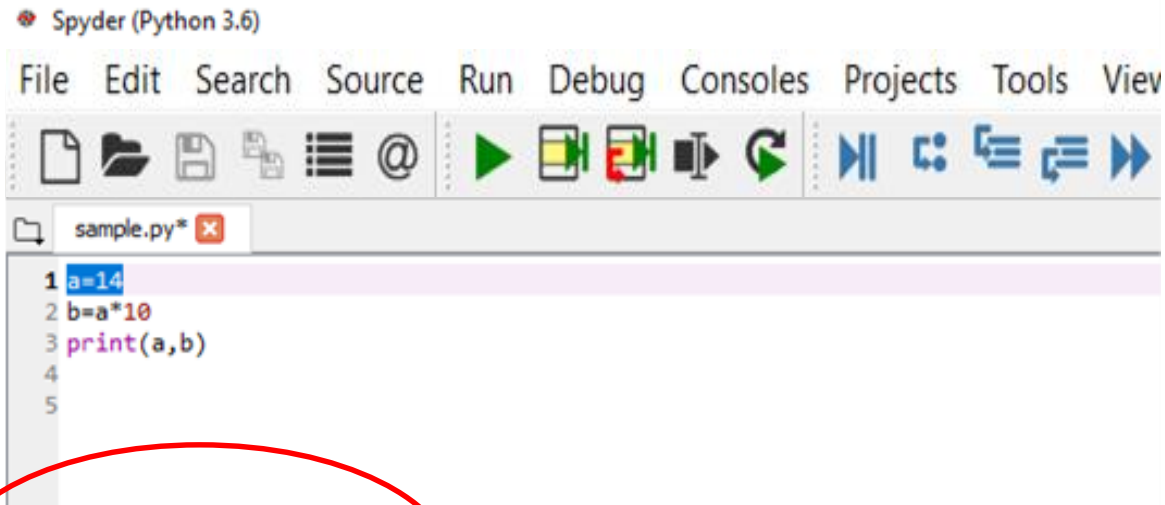

Name	Type	Size	Value
a	int	1	11
b	int	1	110

A large black arrow labeled **RESULT** points from the code to the output in the IPython console. The console shows the execution of the script:

```
In [5]: runfile('C:/Users/DELL/Desktop/sample.py', wdir='C:/Users/DELL/Desktop')
11 110
In [6]:
```

Executing script files using Run selection/F9

Step 1: Assign a new value of 14 to 'a' in the script and press F9

```
1 a=14
2 b=a*10
3 print(a,b)
4
5
```

In [1]: a = 14

Console output

Executing script files using Run selection/F9

Step 2: Select line 2 and press F9

`In [2]: b = a*10` → Console output

Step 3: Select line 3 and press F9

`In [4]: print(a,b)` → Console output
14 140

Commenting script files

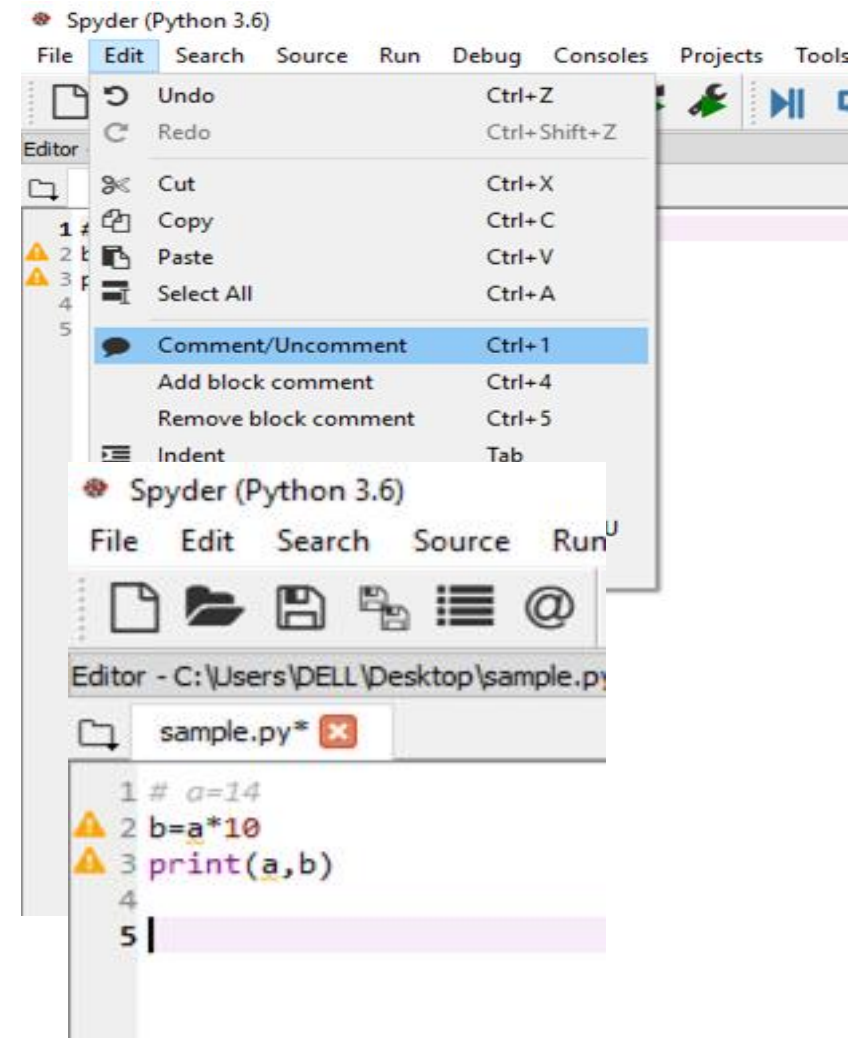

Commenting lines of codes

- Adding comments will help in understanding algorithms used while developing codes
- In practice, commented statements will be added before the code and begin with a '#'
- Multiple lines can also be commented

```
Editor - C:\Users\DELL\Desktop\sample.py
sample.py*
1 #Simple Example
2
3 #Calculate Volume of Cylinder
4 #dia is for diameter
5 dia=5
6 #len is for length
7 len=4
8 #vol is for volume
9 vol=3.14*(dia**2)*len/4
10
11
```

Commenting multiple lines

- Select lines that have to be commented and then press “Ctrl + 1”
- Select “Edit” in menu and select “Comment/Uncomment”
- Uses - to add description, render lines of code inert during testing

Clearing console and environment

Clearing an overpopulated console

Console

```
IPython console
Console 1/A ✕

In [5]: a=14

In [6]: b=a*10

In [7]: print(a,b)
14 140
```

Type `%clear` in console

```
IPython console
Console 1/A ✕

In [5]: a=14

In [6]: b=a*10

In [7]: print(a,b)
14 140

In [8]: %clear|
```

Place cursor on console and press **Ctrl+L**

```
IPython console
Console 1/A ✕

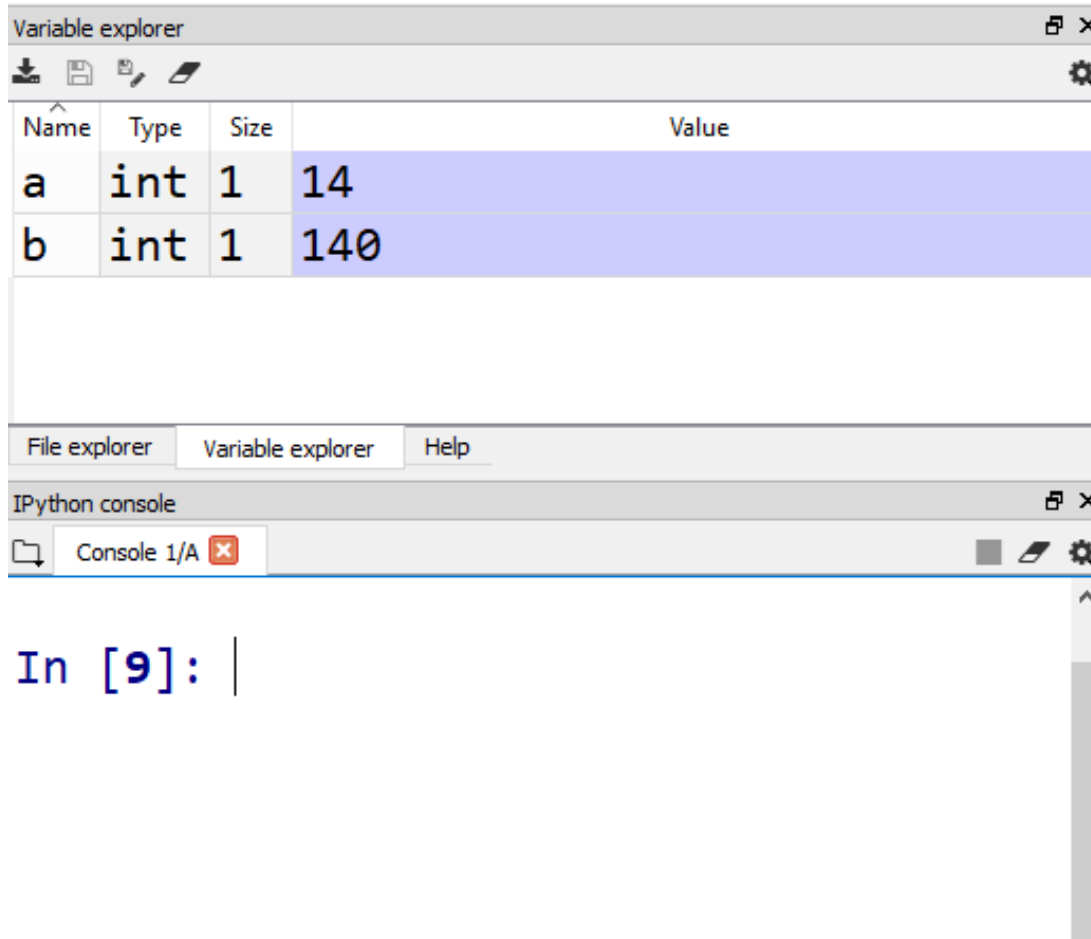

In [5]: a=14

In [6]: b=a*10

In [7]: print(a,b)
14 140

In [8]: |
```

After clearing an overpopulated console

The screenshot shows a Jupyter Notebook interface. At the top, the 'Variable explorer' window is open, displaying a table of variables. Below it, the 'IPython console' window is open, showing the prompt 'In [9]:'.

Name	Type	Size	Value
a	int	1	14
b	int	1	140

Below the table, the 'IPython console' window is visible, showing the prompt 'In [9]:'.

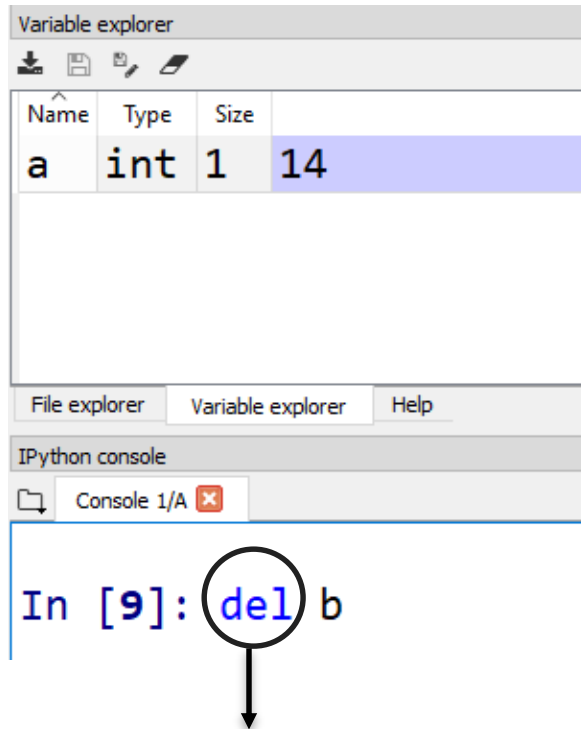

Removing/deleting variable(s)

Environment

Variable explorer			
Name	Type	Size	Value
a	int	1	14
b	int	1	140

Removing/deleting variable(s)

Removing single variable

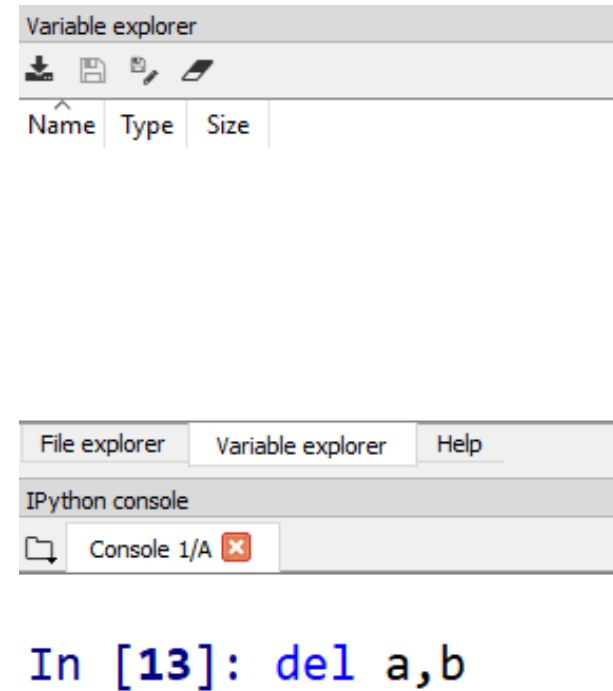

The screenshot shows the Jupyter Notebook interface. The 'Variable explorer' tab is active, displaying a table with one variable 'a' of type 'int' and size '14'. Below the variable explorer, the 'IPython console' shows the command `In [9]: del a`. The word `del` is circled with a black arrow pointing to the text 'Using del followed by variable name'.

Name	Type	Size
a	int	14

```
In [9]: del a
```

Using **del** followed by variable name

Removing multiple variables

The screenshot shows the Jupyter Notebook interface. The 'Variable explorer' tab is active, displaying an empty table. Below the variable explorer, the 'IPython console' shows the command `In [13]: del a, b`.

Name	Type	Size
------	------	------

```
In [13]: del a, b
```

Clearing the entire environment at once

- There are two ways to clear the environment

Method 1

Type **%reset** in console and type **'y'** after the prompt

Clearing the entire environment at once

Method 2

Variable explorer			
Name	Type	Size	Value
a	int	1	14
b	int	1	140

Click the  symbol to remove variables in environment

Variable explorer

Name	Type	Size	Value

File explorer Variable explorer Help

IPython console

Console 1/A

```

In [21]: a=14
...: b=a*10
...: print(a,b)
...:
14 140

In [22]:

Removing all variables...

In [22]:

```

Basic libraries in Python

Basic libraries in Python

- Basic libraries
 - NumPy – Numerical Python
 - Pandas – Dataframe Python
 - Matplotlib - Visualization
 - Sklearn – Machine Learning
- Modules within a library. E.g.-

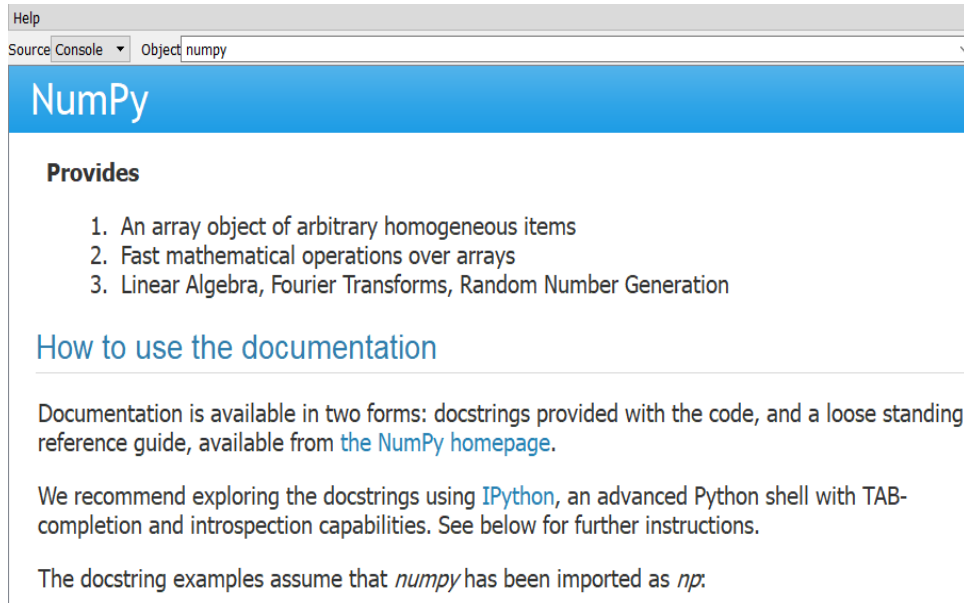

```
import numpy
content = dir(numpy)
print(content)
```

```
IPython console
Console 1/A
'asscalar',
'atleast_1d',
'atleast_2d',
'atleast_3d',
'average',
'bartlett',
'base_repr',
'bench',
'binary_repr',
'bincount',
'bitwise_and',
'bitwise_not',
'bitwise_or',
'bitwise_xor',
'blackman',
'block',
```

Help in Python

Type the name of the library in 'Object'

Help

Source Console Object numpy

NumPy

Provides

1. An array object of arbitrary homogeneous items
2. Fast mathematical operations over arrays
3. Linear Algebra, Fourier Transforms, Random Number Generation

[How to use the documentation](#)

Documentation is available in two forms: docstrings provided with the code, and a loose standing reference guide, available from [the NumPy homepage](#).

We recommend exploring the docstrings using [IPython](#), an advanced Python shell with TAB-completion and introspection capabilities. See below for further instructions.

The docstring examples assume that `numpy` has been imported as `np`:

The following are the sub libraries

Available subpackages

doc	Topical documentation on broadcasting, indexing, etc.
lib	Basic functions used by several sub-packages.
random	Core Random Tools
linalg	Core Linear Algebra Tools
fft	Core FFT routines
polynomial	Polynomial tools
testing	NumPy testing tools
f2py	Fortran to Python Interface Generator.
distutils	Enhancements to distutils with support for Fortran compilers support and more.

Note: You can click the details of the sublibraries by typing ***libraryname.sublibraryname*** under object
Eg- **numpy.lib** in object

Summary

- Execute Python script file
- Commenting lines of code
- Clearing console and environment
- Basic libraries in Python

```
operation == "MIRROR_X":  
    mirror_mod.use_x = True  
    mirror_mod.use_y = False  
    mirror_mod.use_z = False  
operation == "MIRROR_Y":  
    mirror_mod.use_x = False  
    mirror_mod.use_y = True  
    mirror_mod.use_z = False  
operation == "MIRROR_Z":  
    mirror_mod.use_x = False  
    mirror_mod.use_y = False  
    mirror_mod.use_z = True
```

```
#selection at the end -add  
mirror_ob.select= 1  
modifier_ob.select=1  
context.scene.objects.active  
= ("Selected" + str(modifier_ob.name))  
mirror_ob.select = 0  
= bpy.context.selected_objects  
data.objects[one.name].select  
print("please select exactly one mirror")
```

WILLIAM C. LEE

```
def mirror(modifier):  
    #add mirror to the selected  
    #object -mirror_x, mirror_y,  
    #mirror_z  
    mirror_ob = bpy.context.selected_objects[0]  
    mirror_mod = modifier
```

THANK YOU
